SUMMARY

Software Quality Engineer with experience with testing development in Java as well as building features for web applications in React, MongoDB, Python, and Docker. Led regression testing on a generative AI web application leading to a reduction in customer reported defects by 30%. Moved QE timeline forward by communicating with leadership in India and US while proactively initiating test plans. Well versed in the fundamentals of Machine Learning and continuously testing industry trends in AI.

EDUCATION

The University of Texas at El Paso, El Paso, TX *August 2023 - May 2024*
Master's of Science in Software Engineering

- GPA: 3.7
- Relevant Coursework: Data Structures and Algorithms, Programming Language Fundamentals, Database Fundamentals, Computer Architecture, Software Practicum, Web Design, Machine Learning, API Design.

The University of Texas at El Paso, El Paso, TX *August 2019 - May 2023*
Bachelor's of Science in Computer Science

EXPERIENCE

ServiceNow, Hybrid, San Diego, CA Aug 2024 - Present
Software Quality Engineer

- In a Scrum environment on a prompt-based web application, resolved defects, tested user stories, resulting in our team meeting deadlines in an efficient manner.
- Lead automation effort in my team with test cases by using internal frameworks performing UI and headless integration tests in Java, reducing time to automate test cases by 20%.
- Performing regression, accessibility, AB, and other forms of testing on generative AI web application analyzing common failures, taking over 50% of the workload.
- Communicating and collaborating with a team majorly based in India through communicating and attending meetings outside of normal work hours around 20% of the time.

PROJECTS

NAÏVE *September 2022 - April 2023*
Web Application created with Reactjs, MongoDB, and Docker

- In a 1-year long capstone course, contributed to a web app with a team of 8 students utilizing various technologies such as Docker, React, and MongoDB, to create NAIVE.
- The NAIVE system that we proposed was commissioned and used by DEVCOM to analyze an input project folder and map out potential vulnerabilities in a network, reducing the time to map data from 8 hours to 10 minutes.

Fitness Web App: FitCulture *January 2023 - April 2023*
Web Application developed with JS, CSS, HTML, and Firebase

- Produced software for a fitness web app networking with a team of 6 students by using Figma JS, CSS, and HTML resulting in a functional app which allows users to create and record workouts all on a Firebase database.
- Architected the fitness app's dashboard page using JavaScript and Figma, enabling seamless user data interaction with Firebase, resulting in a 50% reduction in average clicks to all functionalities.

Image Classification Project *September 2022 - December 2022*
Machine Learning Project designed with Python and TensorFlow

- Composed and configured, in a team of 2, various models to classify a set of images called the CIFAR-10.
- As a result, due to a more appropriate choice of model, there was an almost 30% increase from model to model.
